

# Writing Files in Python

For writing files we need to use same open function with additional parameter:

`open('sample.txt','w') :`

W stands for write only in this case as soon as you use open function this will delete original content of it even though you call write function or not. Also if there is no such file it will auto create a new file

`open('sample.txt','a') :`

To append the content

```
with open("guests.txt", "a") as guests:  
    guests.write(i + "\n")
```

`open('sample.txt','r+') :`

To read and write both
